ZDS – Seminar „Introduction to the Industrial Manufacturing of Snacks“

Snacks - on the tip of everyone's tongue

Probably no other product range requires so much know-how and experience in raw materials and process technology ensuring the desired distinctive textures and eating characteristics of the products. On the other hand this product field is one of the most interesting ranges within the snacks industry.

The participants of this seminar will get an introduction to the manufacturing technology of extruded and fried snacks based on maize and potato products as well as an overview of a range of various baked snacks.

The aim of the practical course is to provide the participants with basic information on raw materials and their influence on texture, expansion and appearance of snacks. They will get an overview of manufacturing processes of various snacks.

The course is especially for product development, application technology and marketing/sales people working in companies supplying the snacks industry, who like to gain more understanding for the industrial processes involved. But it is also an opportunity for people, who have just started in the snacks industry as well as for those, who are already working there to refresh or extend their knowledge.
